

# Adventure Works Sales Analysis

## Problem Statement

The Adventure Works sales dataset contains four years of transactional records, but the raw data is too large and unstructured to be used directly for business decision-making. The challenge is to clean, organize, and model the data in a way that reveals meaningful patterns in profit, product performance, customer behavior, geography, and time trends.

The objective of this project is to build an interactive Excel dashboard that converts raw sales data into clear business insights. The analysis is designed to help identify the most profitable products, customers, countries, and time periods, while also highlighting areas where performance can be improved.

This project addresses the need for a structured reporting solution that supports better forecasting, segmentation, and strategic planning through data-driven analysis.
